POLICY: Oncology – Inqovi Prior Authorization Policy

• Inqovi® (decitabine and cedazuridine tablets – Taiho Oncology/Otsuka

Pharmaceutical)

REVIEW DATE: 07/28/2021

OVERVIEW

Inqovi, a combination of decitabine (a nucleoside metabolic inhibitor) and cedazuridine (a cytidine deaminase inhibitor), is indicated in adults for the treatment of **myelodysplastic syndrome** (MDS), in adults, including previously treated and untreated, de novo and secondary MDS with the following French-American-British subtypes (refractory anemia, refractory anemia with ringed sideroblasts, refractory anemia with excess blasts, and chronic myelomonocytic leukemia [CMML]) and intermediate-1, intermediate-2, and high-risk International Prognostic Scoring System (IPSS) groups.¹

Decitabine is available as a parenteral product (Dacogen® [decitabine injection for intravenous {IV} use]; generic) and possesses the same FDA-approved indication as Inqovi.² The oral bioavailability of decitabine is limited due to rapid degradation by cytidine deaminase in the gut and liver.¹ As a cytidine deaminase inhibitor, cedazuridine increases decitabine concentrations to therapeutic levels. Oral decitabine has systemic exposure equivalent to the IV form with similar clinical response rates in the population in which Inqovi is FDA-approved.¹,² The recommended dose of Inqovi is one tablet taken orally once daily on Days 1 through 5 of each 28-day cycle for a minimum of four cycles until disease progression or unacceptable toxicity. A complete or partial response may take longer than four cycles. In the two pivotal trials, the median treatment duration was up to 8 months. Do not substitute Inqovi for the IV decitabine product within a cycle.

Guidelines

Inqovi is discussed in guidelines from the National Comprehensive Cancer Network (NCCN) for myelodysplastic syndrome. NCCN myelodysplastic syndrome guidelines (version 3.2021 – January 15, 2021) states that Inqovi can be considered as a substitute for IV decitabine. The guidelines recommend IV decitabine in various clinical scenarios (e.g., treatment of lower risk disease, high-risk disease) and CMML (as a single agent or with Jakafi[®] [ruxolitinib tablets]).³

POLICY STATEMENT

Prior Authorization is recommended for prescription benefit coverage of Inqovi. All approvals are provided for the duration noted below.

Automation: None.

Oncology – Inqovi PA Policy Page 2

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Inqovi is recommended in those who meet the following criteria:

FDA-Approved Indications

- 1. Chronic Myelomonocytic Leukemia. Approve for 3 years if the patient is ≥ 18 years of age.
- Myelodysplastic Syndromes. Approve for 3 years if the patient is ≥ 18 years of age.
 Note: Examples of myelodysplastic syndromes include: refractory anemia, refractory anemia with ringed sideroblasts, and refractory anemia with excess blasts.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Coverage of Inqovi is not recommended in the following situations:

1. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.
