Crixivan is an Antiretroviral Agent, Protease Inhibitor used in the treatment of HIV-1 infection. Crixivan binds to the site of HIV-1 protease activity and inhibits cleavage of viral Gag-Pol polyprotein precursors into individual functional proteins required for infectious HIV. This results in the formation of immature, noninfectious viral particles.

Pre-Authorization Criteria: treatment of HIV infection
Note: should always be used as part of a multidrug regimen (at least three antiretroviral agents)

Note: VCHCP requires that Crixivan be prescribed by an Immunology Clinic physician with current American Academy of HIV Medicine (AAHIVM) Certification, or a physician boarded in Infectious Disease.

Note: Crixivan use in pediatric patients is investigational and therefore an excluded benefit.

Dosing: Adult:
HIV infection: Oral:
Unboosted regimen: 800 mg every 8 hours
Ritonavir-boosted regimen: Ritonavir 100-200 mg twice daily plus indinavir 800 mg twice daily

Dosage adjustments for indinavir when administered in combination therapy:
Delavirdine,itraconazole, or ketoconazole: Reduce indinavir dose to 600 mg every 8 hours
Efavirenz: Increase indinavir dose to 1000 mg every 8 hours
Lopinavir and ritonavir (Kaletra™): Indinavir 600 mg twice daily
Nelfinavir: Increase indinavir dose to 1200 mg twice daily
Nevirapine: Increase indinavir dose to 1000 mg every 8 hours
Rifabutin: Reduce rifabutin to 1/2 the standard dose plus increase indinavir to 1000 mg every 8 hours

Dosing: Pediatric:
HIV: Children 4-15 years (investigational): 500 mg/m² every 8 hours

Dosing: Geriatric:
Refer to adult dosing.

Dosing: Renal Impairment:
No dosage adjustment provided in manufacturer’s labeling (has not been studied).
**Dosing: Hepatic Impairment:**
Mild-moderate impairment due to cirrhosis, monotherapy: 600 mg every 8 hours
Severe impairment: No dosage adjustment provided in the manufacturer’s labeling (has not been studied).

**Dosage Forms: U.S.:**
Excipient information presented when available (limited, particularly for generics); consult specific product labeling.
Capsule, Oral:
Crixivan: 200 mg, 400 mg

Generic Equivalent Available: U.S.-No

**Administration:**
Drink at least 48 oz of water daily. Administer with water, 1 hour before or 2 hours after a meal. May also be administered with other liquids (eg, skim milk, juice, coffee, tea) or a light meal (eg, toast, corn flakes). Administer around-the-clock to avoid significant fluctuation in serum levels. May be taken with food when administered in combination with ritonavir.

**Contraindications:**
Hypersensitivity to indinavir or any component of the formulation; concurrent use of alfuzosin, alprazolam, amiodarone, cisapride, ergot alkaloids, lovastatin, midazolam (oral), pimozide, simvastatin, St. John's wort, or triazolam; sildenafil (when used for pulmonary artery hypertension [eg, Revatio®]).

**Exclusions:**
Pediatric use is investigational and therefore an excluded benefit (see EOC).

**Adverse Reactions:**
>10%-Abdominal pain, nausea, hyperbilirubinemia, nephrolithiasis/uroolithiasis, including flank pain with/without hematuria.
Other Severe Less Common Reactions: interstitial nephritis, hyperglycemia, diabetes mellitus, hypercholesterolemia, hypertriglyceridemia, pancreatitis, hepatotoxicity, Stevens-Johnson syndrome, erythema multiforme, hemolytic anemia, thrombocytopenia, immune reconstitution syndrome, autoimmune disorders. Fat redistribution, hyperbilirubinemia.
